User preferences AutoCAD has an extensive system of user preferences. They can be modified in the preferences dialog. Raster images The AutoCAD Raster layer support native to the program allows users to create and modify raster image files (.ai and .eps). Histogram The Histogram tool, available in later releases, displays the distribution of pixel values for a specified color, gray scale, or gradation value. It is an extension of the Histogram tool, which calculates and displays the most frequent values of all the pixels within an area specified by the selection brush. A typical use for the Histogram tool would be to determine the value ranges for a particular color before making changes to the color. Built-in symbols AutoCAD provides many built-in symbols to support creating drawings quickly and easily, including arrows, beams, circles, circles with arrows, chevrons, circles with arrows, chevrons with arrows, cubes, cylinders, DWG and DXF symbol libraries, lines, lines with arrows, loops, parabolic arcs, rectangles, rectangles with arrows, rays, semicircles, sinusoids, spirals, spirals with arrows, triangles, triangles with arrows, trapezoids, text, and text with arrows. These can be used for creating diagrams, annotations, and shading. Extensions AutoCAD includes a large number of external programs and extensions that provide additional functionality and allow users to perform new tasks. They include pre-installed utilities such as engineering and drafting tools for creating wireframes, making 2D and 3D models, laser cutting, DWG file export and import, adding annotated layers to drawings, and workflows for various manufacturing and development processes. External plugins are available for creating a database of drawings, exporting the drawing from the program as a model file, printing, converting the drawing into a PDF document, and allowing for motion tracking. Manufacturing and production The Manufacturing module enables manufacturers and engineering

firms to configure their drawings and add annotation layers that include tool path creation, bill of material, engineering assembly drawing, and project management. It uses the AutoCAD DWG format. In addition to importing a CAD file from the standard DXF format, AutoCAD imports files from multiple other formats including: .dwg, .dxf, .dwg, .dwgt, .dwgtx, .dwgmx, .dw ca3bfb1094

The U.S. is preparing to lay out new rules regarding the use of biometric identity technology, setting the stage for a new era in which the government could use this sort of digital data to issue government IDs that “read” your face or eye color. Since the 9/11 terrorist attacks, law enforcement agencies have relied on biometric data collected by license plate readers, bank ATMs, and other technologies. Now, the government wants to use biometrics to identify Americans much more broadly, both to confirm their identities and to verify their eligibility to access certain government benefits. But as with any new technology, there is a balancing act between the potential benefits of increased security and the potential costs that come with it. The government already has a system in place that would allow for the widespread use of biometrics. The Secure Communities program, which came online in 2008, builds a database that shares fingerprint data with local, state, and federal law enforcement agencies. The National Security Agency (NSA) has pioneered biometrics in the war on terror, using biometric technology to confirm the identities of foreign travelers at the border. But civil liberties groups have expressed concerns that the government might be using the technology to create a “biometric ID card” that would more easily track Americans. The Electronic Privacy Information Center (EPIC), a civil liberties group, has filed an open records request with the Department of Homeland Security (DHS) for records related to the agency’s plans to create a biometric ID card. The new system would allow the government to verify people’s identities in a range of ways, including verifying their identities using facial recognition technology and conducting retina scans. Because the system would share information with many agencies, the government
