KMSpico v9.0.5.20131110 RC.The present invention relates to a method and apparatus for processing materials, and more particularly to a method and apparatus for processing tobacco. Within the industry, there are a variety of situations in which it is desired to limit the size of the tobacco used to make a particular product. In the context of a tobacco rod, tobacco that has not been limited in size will generally be subjected to expansion upon moisture absorption, which, coupled with the relatively low density of the tobacco, can result in the tobacco rod becoming unstable and likely to crumble during storage and handling. If the amount of tobacco within the tobacco rod is too small, the rod will likely collapse during storage and handling. Since smaller rods are less stable, if the rod does not have a stable shape, the rod will be prone to becoming canted within the wrapper, resulting in product appearance problems. In the context of cigarette manufacture, tobacco which has not been sized will generally be subject to shrinkage during the drying process. If the amount of tobacco within the cigarette is too small, the cigarette will be unstable and prone to collapsing during storage or handling. If the amount of tobacco within the cigarette is too small, the cigarette will have a less pleasing smoker's product appearance. As a cigarette is typically packed into a box or carton, the amount of tobacco between cigarettes varies from side-to-side, front-to-back and vertically. There is also typically an excess of tobacco on the outer edges of the box, as well as tobacco occupying space in the bottom and side walls of the carton. It is desirable to make the amount of tobacco within a cigarette equal on each side, as well as in
