This is a very simple and straightforward command, and it can be used to find any file on your computer. We now have the file path to the file that we would like to remove, so we want to use the -r option to remove the file. We will now remove the file. Using the rm command rm is the command in Unix and Unix-like operating systems that allows you to remove files, folders, and other objects. Therefore, you can use the command with two types of options. In this case, we want to remove all the files that are in the parent folder of the directory that we are in. Therefore, we will use the -r option with the command. Command The -r is the recursive option, which means that any sub-folders that contain files will also be removed. Therefore, you will see everything in the parent folder and below all the folders in the parent folder will be removed as well. If you do not want to remove the directories that are inside of the parent folder, you will use the -f option. This will stop the command from removing the directories. Viewing the files that are in the current directory Now that we have removed the file that we wanted to remove, you should be able to see the file that we wanted to remove. ls -la To make this easier, we will list all of the files in the current directory. The output should look like this. ls -la You will now see the files that are in the parent folder. [image] The -la means to show the file in more detail. What we are looking for is to list all the files in a long list. To do this c6a93da74d
